Taylor Scheduling Software Inc. also provides Interfacing services at guaranteed pricing to connect the legacy ERP, MRP, MRPII (or other systems) to the Scheduler and Planner.

This service provides the technology required to transfer information from shared datatables which are populated by the customer's IT team to the Taylor application. These datatables reside in the Taylor system and define the required information for the Scheduler or Planner to do their job properly.

Once the Schedule or Plan is decided, the information required for the Legacy system the interface works to communicate the information back to the other system. The data mapping exercise is a shared task where Taylor provides the customer IT expert with the "information required" for the Taylor application to work properly and the Customer IT expert establishes an "export function" from the legacy system to the Import Data Table with the appropriate information. Then the Taylor IT expert provides the data in and the data our functions necessary to get the two systems "talking".

The service includes all engineering time required, development of the interface program required for the specific application and corrections required to meet the original specification until synchronization is achieved.

For programming specifics or references to customers who have used this service, please contact info@taylor.com.

Timing
Is
Everything
